## MANUAL MEDICAL RATING FORMULAS

### Instructions

- A. Run the census through penetration and translation assumptions to create member-level census. (Skip to B if census is already at the member level.)
- B. Run each individual from the census in A through the calculation steps 1-10 to determine base medical claim costs. Hold the resulting per member per month claim costs.
- B1. For EPP products, run steps 1-10 using EPP assumptions.
  - B2. For DPP products, run steps 1-10 once using EPP in-network assumptions and run steps 1-10 again using DPP out-of-network assumptions.
  - B3. For PPO products, run steps 1-10 once using PPO in-network assumptions and run steps 1-10 again using PPO out-of-network assumptions.
  - B4. For EPO products, run steps 1-10 once using PPO in-network assumptions.
  - B5. For Indemnity products, run steps 1-10 using Indemnity assumptions.
  - B6. For OAP products, run steps 1-10 once using OAP in-network assumptions and run steps 1-10 again using OAP out-of-network assumptions.

- Step 1 - Extract the National Base Claims
- Step 2 - Calculate Trend Factor
- Step 3 - Apply Trend Factor
- Step 4 - Apply Copay Impact Factors to Cost Categories
- Step 5 - Cost-Sharing Offset
- Step 6 - Utilization Dampening
- Step 7 - Base Medical Community Rate
- Step 8 - Industry Load and Capitation Factor
- Step 9 - Demographic Adjustment
- Step 10 - Base Medical Community Rate by Class (CRC) PMPM

C. Other Benefits

- Step 11a - Rider
- Step 11b - Mental Health/Substance Abuse

D. Aggregate individual per member per month claim costs.

- Step 12 - Aggregate Individual Claim Costs
- Step 13 - Blending In and Out of Network - Applicable to DPP, OAP and PPO products only.

E. Create per member per month revenues by tier.

- Step 14 - Final Tiered Rates

### Detailed Formulas

The following steps detail the claim cost calculation process. Except where noted, the identical process is followed to determine both in-network and out-of-network claims. The specific steps are applied to each cost category, except as noted. Claim costs for each individual life are calculated separately and the results aggregated.

#### **SECTION B**

##### Step 1 - Extract the National Base Claims

Base claim costs are established for experience-rated business. Base Costs are set nationally for Open Access Plus product type and cost category. Major Service Categories (MSC) include: inpatient, outpatient surgical, emergency room, primary care physician, specialty care physician and other.

Within each MSC, there is also a Sub Cost Category (SCC) for services performed at those facilities. Those SCC include: Facility, Professional, Diagnostic Lab/Xray (DXL), Advanced Radiology (ARI), PCP, SCP, Surgery, and Other Services

Extract the base claims for each MSC from the applicable pricing table. Then extract the applicable percentages for each SCC:

Formula:  
Base Claim Cost by MSC and SCC = Base Claim Cost by MSC x SCC %

For products that contain in-network and out-of-network features (PPO, OAP and DPP), first extract the in-network claim costs and proceed with the remaining steps 2 - 10. After completion of steps 2 - 10, extract the out-of-network claim costs and proceed with the remaining steps 2 - 10.

The Base Claims in Tables III EU BA1-5 reflect end-state, experience-rated business.

### Step 2 - Calculate Trend Factor

Determine the total trend days from the base claim period midpoint to the policy period midpoint. Calculate the trend years by exposure year and calculate applied trend. Use trend factors per the pricing tables specific to the particular product being priced.

Formulas:  
Extract trend factors from the pricing tables for the particular product being priced.  
Base claim period midpoint = base claim effective date + 182.5 days (use 183 days if leap year)  
Policy period midpoint = (policy effective date + next policy effective date) / 2  
Total trend days = policy period midpoint - base claim period midpoint

For all years between the base claim effective date and the next policy effective date, calculate the following:

(a) = first day of year n+1, where n = base claim effective date year, base claim effective date year + 1, ..., up to next policy effective date year  
(b) = base claim effective date + total trend days  
(c) = minimum of (a) & (b)  
(d) = first day of year n  
(e) = base claim effective date  
(f) = maximum of (d) & (e)  
(g) = maximum of [ 0, (c - f) ]  
(h) = number of days in year n (365, unless leap year)  
Trend exponent for exposure year n = (g) / (h)

Total trend factor = Product of [(1 + trend factor for exposure year n) ^ (trend exponent for exposure year n)]  
for all values of n

### Step 3 - Apply Trend Factor

Apply the total trend factor determined in step 2 to each MSC and SCC in step 1.

Formulas:  
Step 3 base claims = Step 1 Adjusted Base Claims x Step 2 total trend factor

### Step 4 - Apply Copay Impact Factors to Cost Categories

Extract the utilization factors for each applicable base claim MSC from the applicable pricing tables (i). Extract the SCC percentages from the applicable pricing tables (ii). Extract the copays per the plan design. Calculate the dollar offset for each cost category, excluding MHSA. The impact for Mental Health & Substance Abuse is calculated in step 5B.

Formulas:  
Dollar copay impact = ( utilization factor for each MSC x SCC % x applicable copay for each cost category\* ) / 12 [do not include MHSA]  
\* Note that the effective ER Copay is combination of 1/3 UC Copay + 2/3 ER Copay  
Step 4A adjusted base claims = Step 3 base claims - dollar copay impact  
Step 4A copay employee pay percentage =  $\frac{\text{(dollar copay impact)}}{\text{(step 3 base claims)}}$

### Step 5 - Cost-Sharing Offset

Formulas:  
Extract the individual and family out of pocket maximum from the plan design.  
Extract the Deductible Adjustment Factor and OOP Max Adjustment Factor from the table based on the individual deductible and the ratio of family deductible/individual deductible.  
Extract the claim cost distribution with annual frequency and claim costs for each cost category in Step 1.

Effective Deductible = Individual Deductible x Deductible Adjustment Factor  
Effective OOP Max = Individual OOP Max x OOP Max Adjustment Factor

**Step 5A Base Claim Costs**  
Adjust the Claim Cost Distribution to reflect the trended claims in Step 3.  
5A.i Find the expected value of the total claim claim costs in table [Claim Distribution Table]  
5A.ii Sum all expected, trended claims found in Step 3 across all MSC and SCC  
5A.iii Find the ratio os 5Aii / 5Ai  
5A.iv For each row of probabilities in the [Claim Distribution Table], multiply each MSC and total claims by the ratio computed in step 5A.iii

Calculate for each row of the claim distribution table, calculate the MSC by SCC by multiplying the value in 5A.iv by the perenatges extracted in step 1 for each row in the claim distribution table.  
As an example:  
(a) Annual Hospital Out Patient Facility Claim = OP MSC claim (5A.iv) x OP Facility %

(a) Annual Claim Total = Sum of (a) Annual Claims for each Cost Category

**Step 5B Copay** ; calculate for each row of the claim distribution table the (b) Claims After the Deductible for each MSC and SCC  
Compute the (b) Annual Claims adjusted for plan cost and copays by multiplying annual claim cost by MSC and SCC (Step 5A) by copay offset % (step 4A)  
As an example:  
(b) Annual Hospital Out Patient Facility (post copay offset) = Annual Hospital Out Patient Facility x (1 - copay employee pay percentage)

(b) Annual Claim Total = Sum of (b) Annual Claims for each Cost Category  
(b) Member Cost Sharing from Copays = (a) Annual Claim Total - (b) Annual Claim Total

**Step 7 - Base Medical Community Rate (CR) PMPM**

Total claims adjusted for copays, deductibles, coinsurance, utilization dampening, and gatekeeper credit summed for all individuals in a given area and tier.

Formula:  
 Base Medical Community Rate PMPM = [Step 3 base claims x (1 - Step 5(h.4) by cost category)  
 x Step 6 utilization dampening x (1+ gatekeeper credit from table(if applicable)) x(1+multiple offering load from tables (if applicat  
 x med area factors from tables x Product factor from tables<sup>(1)</sup> x (1+health advocacy factor (if applicable)) x (1+lifetime max facto  
 x (1+Deductible Accumulation Adjustmen<sup>(2)</sup>) x (1+Carryover Deductible Adj) x (1 + Consumerism Adj)  
 x (1+Office Surgery Adj) x (1 + Combined Deductible Adjustment) x (1+Breast Pump Supplies Adj)  
 x (1 + 100% Preventive Care Adj)

(1) This factor translates the Open Access Plus Product into other products (e.g., HMO and Indemnity)  
 (2) This is an adjustment to go from IN and OON deductible cross accumulation to no cross accumulation. Cross accumulation means out of network spending applies towards out-of-network deductible and in-network deductible

Select the applicable percentage attributes from the pricing table for each cost category.

**Step 8 - Industry Load and Capitation Percentage**

Determine applied industry load for each cost category.

Formulas:  
 Select the full industry load from the pricing table based on the SIC code and case size of the group being priced.  
 A case size of small applies for groups with less than 1,000 subscribers.  
 Select the capitation percentage from the pricing table for each cost category.

Adjusted industry load = (full industry load - 1) x (1 - capitation percentage )

Step 8 applied industry load (by cost category) = 1+ adjusted industry load

**Step 9 - Demographic Adjustment**

Apply demographic and industry loads to Community Rate PMPM summed for all individuals in a given area and tier.  
 Demo Loads are a function of Sex/Age/Status of the client and deductible amount. Status includes employee, spouse and children.  
 If status of a member cannot be determined, the Demo load are a function of Sex/Age and deductible amount.

**Step 10 - Base Medical Community Rate by Class (CRC) PMPM**

If status of a member can be determined, extract the age/sex/status/deductible demographic factor from the pricing tables for the particular individual being rated.  
 If status of a member cannot be determined, extract the age/sex/deductible demographic factor from the pricing tables for the particular individual being rated.

Formulas:  
 Base Medical Community Rate by Class PMPM = Step 7 Medical CR x Step 8 applied industry load  
 x ( Step 9 age/sex/status/deductible factor OR Step 9 age/sex/deductible factor)

**SECTION C2**

**Step 11 - Other Benefit Riders**

Step 11a - Rider

Extract other benefit rider base cost pmpms per the pricing table according to the plan design. Adjust for trend, demographic and industry loads per the other benefit load table.

Formulas:  
 For each rider use the following:  
 Extract the rider base cost pmpm per the pricing table.  
 Trend = step 2 medical trend factor (except for Vision riders, use 1.03). Mental Health/Substance Abuse has own trend (may vary by product/rating area).  
 Age/sex/deductible factor = step 9 age/sex/status/deductible demographic factor  
 Industry load = step 8 applied industry load

Step 11 rider pmpm = rider base cost pmpm x trend x age/sex/status/deductible factor\* x industry load  
 Step 11 total riders = sum of all rider pmpms

\* age/sex/status/deductible factor applies to all rider except infertility rider pmpm. Infertility rider has its own age/sex factor that does not depend on status/deductible.  
 \*\* For HMO and NWK products, the mental, 'health & substance abuse coverage is capitated and will be included as a rider to the base plan.

Step 11b - Mental Health/Substance Abuse

Extract the MHSA base cost pmpm per the pricing table.(The table key varies by deductible/copay/coinsurance)  
 Trend = 7.00%  
 FFS Adjustment = 1% (This is applied to MHSA Cap pmpm)

Step 11b MHSA pmpm = MHSA base cost pmpm x trend x FFS Adjustment  
 This is only for Open Access Plus and PPO product

**SECTION D**

**Step 12 - Aggregate Medical Claim Costs**

Combine the individual per member per month claim costs to determine aggregate costs by area and tier.

*Determine aggregate pmpm for each area (defined as network/pricing module/site combination):*

Step 12 total aggregate PMPM by area by tier =  $\frac{\text{sum the step 10 total PMPM for all individuals (members) within the given area and tier}}{\text{sum of the number of members within the given area and tier}}$

*Determine aggregate pmpm for each other benefit for each area (defined as network/pricing module combination):*

Step 12 aggregate riders by area by tier =  $\frac{\text{sum the step 11 total riders PMPM for all individuals (members) within the given area and tier}}{\text{sum of the number of members within the given area and tier}}$

Step 12 aggregate MHSA by area by tier =  $\frac{\text{sum the step 11 total MHSA PMPM for all individuals (members) within the given area and tier}}{\text{sum of the number of members within the given area and tier}}$

Step 12 aggregate other benefits by area by tier = 'Step 12 aggregate MHSA by area by tier + 'Step 12 aggregate riders by area by tier

**Step 13 - Blending Medical In and Out of Network**

For products with an in-network and an out-of-network component, such as POS, this step blends the in-and out-of-network base medical costs to create one overall rate. Once steps 1-10 have been completed for both in-network and out-of-network, use the specific in-network and out-of-network rating factors in the following formulas. Blending is done by tier at the area level.

Formulas:  
 Select the applicable base POS load factor from the pricing table. POS load is the pmpm of a blended product divide by the pmpm of an lockin product.  
 Extract the followings from the pricing table which vary by specific areas and products.

1. A, B, and C factors
2. Average Cost Share differences between in-network and out-network (X)

After we get the average POS info, we need to calculate the case specific POS load.  
 Case POS Load =  $A \times X^2 + B \times X + C$

Case POS load After MRC =  $\text{Max}(\text{Case POS Load}, 0) \times \text{MRC Factor}$

Calculate the in-network and OON-network utilization  
 In-Network Utilization =  $\frac{\text{Max}(\text{Min}(\text{step 12 total aggregated in-network pmpm} \times (1 - \text{Step 8 aggregated capitation percentage}) \times (1 + \text{Case POS load After MRC}) - \text{step 12 total aggregated out-of-network pmpm})}{\text{step 12 total aggregated in-network pmpm} \times (1 - \text{Step 8 aggregated capitation percentage}) - \text{step 12 total aggregated out-of-network pmpm}}$

Out-of-Network Utilization =  $1 - \text{In-Network Utilization}$

If OON pmpm is lower than IN PMPM, IN Util will be set to 100%.

Step 13 blended PMPM =  $[(\text{step 12 total aggregated in-network pmpm} \times \text{Step 8 aggregated capitation percentage}) + (\text{step 12 total aggregated in-network pmpm} \times (1 - \text{Step 8 aggregated capitation percentage}) \times \text{step 13 in-network utilization}) + (\text{step 12 total aggregated out-of-network pmpm} \times \text{step 13 out-of-network utilization})]$

Step 13 blended community rated PMPM =  $[(\text{step 12 total community rated in-network pmpm} \times \text{aggregate capitation percentage}) + (\text{step 12 total community rated in-network pmpm} \times (1 - \text{capitation percentage}) \times \text{step 13 in-network utilization}) + (\text{step 12 total community rated out-of-network pmpm} \times \text{step 13 out-of-network utilization})]$

**SECTION E**

**Step 14 - Final Tiered Rates**

Formulas:  
 For EPP, EPO and Indemnity products, without either FlexCare/CIGNA Pharmacy Plus or RxPrime/CIGNA Pharmacy:  
 Step 14 final tiered PMPMs =  $\frac{(\text{step 12 total aggregate PMPM by area by tier} + \text{step 12 aggregate other benefits by area by tier} + \text{step P13 total aggregated pharmacy PMPM by area by tier})}{\text{applied loss ratio}}$

For EPP, EPO and Indemnity products, with FlexCare/CIGNA Pharmacy Plus or RxPrime/CIGNA Pharmacy:  
 Step 14 final tiered PMPMs =  $\frac{(\text{step 12 total aggregate PMPM by area by tier} + \text{step 12 aggregate other benefits by area by tier})}{\text{applied loss ratio}}$

For DPP, OAP and PPO products, without either FlexCare/CIGNA Pharmacy Plus or RxPrime/CIGNA Pharmacy:  
 Step 14 final tiered PMPMs =  $\frac{(\text{step 13 blended PMPM} + \text{step 12 aggregate other benefits by area by tier} + \text{step P13 total aggregated pharmacy PMPM by area by tier (or RxPrime, if applicable)})}{\text{applied loss ratio}}$

For DPP, OAP and PPO and Indemnity products, with FlexCare/CIGNA Pharmacy Plus or RxPrime/CIGNA Pharmacy:  
 Step 14 final tiered PMPMs =  $\frac{(\text{step 12 total aggregate PMPM by area by tier} + \text{step 12 aggregate other benefits by area by tier})}{\text{applied loss ratio}}$

## SECTION C1 - PHARMACY MANUAL RATING FORMULAS

### INSTRUCTIONS:

Use this section to calculate fee-for-service pharmacy expected claim costs.

PA. Run each individual from the census through the calculation steps as indicated below. Hold the resulting per member per month claim costs.

- Step P1 - Extract the Average Wholesale Price per Script
- Step P2 - Apply the Discount
- Step P3 - Calculate Gross Cost Per Script
- Step P4 - Calculate and Apply the Cost Trend Factor
- Step P5 - Extract the Script Counts Across All Drug Categories
- Step P6 - Calculate and Apply Utilization Trend Factor
- Step P7 - Calculate Gross Trended PMPM
- Step P8 - Calculate Gross Area-Adjusted PMPM
- Step P9 - Calculate Regular Cost Share Using Claims Probability Distribution (CPD)
- Step P10 - Calculate Adjusted Cost Share for 4th-tier Cost Categories
- Step P11 - Calculate Regular Cost Share PMPM, Regular Net Pharmacy PMPM, and Adjusted Cost Share PMPM
- Step P12 - Calculate Aggregate Metrics
- Step P13 - Calculate Net Pharmacy Rate
- Step P14 - Apply the Clinical Modules Factor
- Step P15 - Apply the Pharmacy Demographic Adjustment
- Step P16 - Apply the Pharmacy Industry Adjustment
- Step P17 - Apply the Pharmacy Mandates Adjustment
- Step P18 - Calculate and Apply Utilization Dampening Adjustment

PB. Determine the Final Pharmacy PMPM for each individual.

- Step P19 - Determine Final Pharmacy PMPM

PC. Aggregate individual per member per month claim costs.

- Step P20 - Aggregate Individual Claim Costs

### DETAILED FORMULAS:

The following formulas detail the claim cost calculation process. The specific steps are applied to each cost category, except as specifically noted. It should be noted that there are no separate provisions made for OON pharmacy benefits. All benefits are assumed to be in network. Claim costs for each individual life are calculated separately and the results are aggregated. Where noted, a separate set of assumptions or calculations are used for cases run on the FACETS platform.

### SECTION PA

#### **Step P1 - Extract the Average Wholesale Price per Script**

Extract the AWP per script by cost category in both the retail and mail order (MOD) buckets (note: separate assumptions for FACETS platform). AWP per script varies by Formulary Status (Closed vs. Open) and Formulary Type (Standard, Performance, Advantage, Generics Only).

## Step P2 - Apply the Discount

Discounts are estimated for retail and mail. The discounts vary by funding type. Discounts also differ for the FACETS platform, which has separate discounts for its 90-day retail option. If applicable, discounts are adjusted for 90-day retail option.

### Formula:

Final Retail Tier Discount = 30-Day Retail Discount x (1 - % of Retail from 90-Day) + 90-Day Retail Discount x % of Retail from 90-Day  
where % of Retail from 90-Day =  $\frac{[(\text{Retail Script Counts} \times \text{Retail shift to 90-Day Supply}) + (\text{MOD Script Counts} \times \text{MOD Shift to 90-Day Supply} \times \text{MOD Multiplier Assumption})]}{\text{Retail Script counts}}$

If selecting Performance 4-Tier product, where non-preventive generics and preferred brand share the second tier, one needs to calculate a weighted average discount to use.

### Formula:

Performance 4-Tier Product, 2nd Tier Discount for Retail or MOD =  
 $1 - \frac{[(\text{Non-Preventive Generics Script Counts} \times \text{Non-Preventive Generics AWP}) \times (1 - \text{Generic Discount}) + (\text{Preferred Brand Script Counts} \times \text{Preferred Brand AWP}) \times (1 - \text{Preferred Brand Discount})]}{[(\text{Non-Preventive Generics Script Counts} \times \text{Non-Preventive Generics AWP}) + (\text{Preferred Brand Script Counts} \times \text{Preferred Brand AWP})]}$

Once discount is calculated, apply it to Average AWP.

### Formula:

Step P2 Discounted AWP = (1 - Discount Factor) x Step P1 Average AWP

## Step P3 - Calculate Gross Cost Per Script

Dispensing fees are estimated for retail and mail. They vary by funding type and differ for the FACETS platform. For mail, dispensing fees don't vary between brand and generic drugs. For retail, they do.

Sales tax is not included in either for retail or mail due to insignificance.

### Formula:

Step P3 Gross Cost Per Script = Step P2 Discounted AWP + Dispensing Fee

## Step P4 - Calculate and Apply the Cost Trend Factor

Determine the total trend days from the base claim period midpoint to the policy period midpoint. Calculate the trend years by exposure year and calculate applied trend. Use trend values specific to the particular product being priced. Trend values will also vary by year.

Unit Cost Trend Factor is the sumproduct of days to trend in specific years with those years' corresponding trend factors.

### Trend Calculation Example:

- (a) = Product = OAP
- (b) = Base claim effective date = 1/1/2011
- (c) = Policy effective date of quote = 07/01/2012
- (d) = Policy end date of quote = 06/30/2013
- (e) = Annual OAP cost trend factor for 2012/2011 = 4.3%
- (f) = Annual OAP cost trend factor for 2013/2012 = 6.5%
- (g) = Base claim period midpoint =  $b + 182.5 \text{ days} = 7/2/2011$
- (h) = Policy period midpoint =  $(c + d) / 2 = 12/30/2012$
- (i) = Total trend days =  $h - g = 546.5$
- (j) = Trend days from 2011 to 2012 = 364.5
- (k) = Trend days from 2012 to 2013 = 182

Unit Cost Trend Factor =  $(1 + e)^{(j / 366)} \times (1 + f)^{(k / 365)} = (1.043)^{0.996} \times (1.065)^{0.499} = 1.076$

Formula:

Step P4 Gross Trended Cost per Script = Step P3 Gross Cost per Script x Unit Cost Trend Factor

**Step P5 - Extract the Script Counts Across All Drug Categories**

Extract the retail and MOD script counts PMPY for each cost category (note: separate assumption for FACETS platform). Pull in script counts for buy-up cost categories (e.g. Oral Contraceptives, Smoking Cessation, etc.) as needed. If the category-specific buy-up has not been selected, set the script count to 0. If it has been selected, pull the script count normally as previously mentioned. Utilization by tier varies by Formulary Status (Closed vs. Open) and Formulary Type (Standard, Performance, Advantage, Generics Only). If applicable, script counts are adjusted for 90-day retail option.

Formulas:

Final Retail Script Count = Extracted Retail Script Count + (90-Day Retail Shift from MOD Assumption x MOD Multiplier Assumption x MOD Script Counts)

Final MOD Script Count = Extracted MOD Script Count x (1 - MOD Shift to 90-Day Retail Assumption)

**Step P6 - Calculate and Apply Utilization Trend Factor**

Calculate the utilization trend factor by re-running Step P4 with utilization trend factors.

Formulas:

Utilization Trend Factor = Result of Step P4 using utilization trends instead of cost trends

Step P6 Trended Script Count = Step P5 Script Count x Utilization Trend Factor

**Step P7 - Calculate Gross Trended PMPM**

Calculate Gross Trended PMPM by multiplying trended script count by trended cost per script and dividing by 12 (scripts are PMPY).

Formula:

Step P7 Gross Trended PMPM = Step P4 Gross Trended Cost per Script x Step P6 trended script count / 12

**Step P8 - Calculate Gross Area-Adjusted PMPM**

Extract the area factor. This factor is based on the site/funding type being rated.

Formula:

Step P8 Gross Area-Adjusted PMPM = Step P7 Gross Trended PMPM x Rx Area Factor

**Step P9 - Calculate Regular Member Cost Share Using Claims Probability Distribution (CPD)**

Extract the co-pays/co-insurance, deductible, applicable deductible waivers, out-of-pocket maximum, and plan maximum for the plan design.

**Step P9a - Readjust Distribution to Appropriate Rate Level**

Scale PMPY cost for each row and tier of the pharmacy CPD table, by the case-specific utilization and cost by tier derived in steps P1 through P6. The tiers should be further split into preventive vs. nonpreventive.

**Formula:**

For each row and tier of CPD,

Step P9a Gross PMPY by Tier = Step P8 Gross Area-Adjusted PMPM / (weighted average of PMPY's within each tier from each row)

**Step P9b - Calculate Deductible Impact, Adjust for Excluded Preventives**

Compare the summed Gross PMPY's by Tier for each row to the deductible to see how much of the deductible is applied for each row. If the client elects to waive preventive drugs, do not apply those costs to the summed Gross PMPY's by Tier.

Note: For combined deductible, no deductible is used. Instead an adjustment is made as part of the final community loads.

**Formula:**

For each row of CPD,

Step P9b Deductible Applied = Min [Sum(Step 9a Gross PMPY by Tier), Deductible]

**Step P9c - Calculate Percentage of Costs Left after Deductible is Applied**

**Formula:**

For each row of CPD,

Step P9c Percentage Left =  $1 - [\text{Step P9b Deductible Applied} / \text{Sum(Step P9a Gross PMPY by Tier)}]$

**Step P9d - Estimate Remaining Member Costs per Script**

Take cost per script from each row and tier from the scaled CPD table after step P9a and by the percentage left over after the deductible is applied.

**Formula:**

For each row and tier of scaled CPD after step P9a,

Step P9d Per Script Cost per Tier = (Cost per Script from scaled CPD) x Step P9c Percentage Left

**Step P9e - Adjust for Copays/Coinsurance**

To obtain adjusted member costs per script for each tier, factor in copay or coinsurance impact.

**Formula:**

For each row and tier of CPD,

If copay plan:

Step P9e Adjusted per Script Cost per Tier = Min (Tier copay, Step P9d Per Script Cost per Tier)

If coinsurance plan with minimum and maximum copays:

Step P9e Adjusted per Script Cost per Tier = Min [Max (Tier coinsurance x Step P9d Per Script Cost per Tier, Min Copay), Max Copay]

**Step P9f - Calculate Aggregate Member Cost Share**

**Formula:**

For each row of CPD,

Step P9f Aggregate Member Cost Share = Sum [(Step P9e Adjusted per Script Cost per Tier) x (Number of Scripts) + Step P9b Deductible Applied]

**Step P9g - Adjust for Out-of-Pocket Maximum**

Factor in impact of OOP maximum on member cost share.

**Formula:**

For each row of CPD,

Step P9g Cost Share after OOP Max = Min (OOP Max, Step P9f Aggregate Member Cost Share)

**Step P9h - Adjust for Plan Maximum**

Factor in the impact of the plan maximum on member cost share.

Formula:

For each row of CPD,

Step P9h Cost Share after Plan Max = Max (Step P9g Cost Share after OOP Max, Total Estimated Cost - Plan Max)

**Step P9i - Calculate Final Cost Share**

Compare the weighted average (by row) of the member cost share with the weighted average of the total cost.

Formula:

Step P9i Regular Member Cost Share = Weighted average (Step P9h Cost Share after Plan Max) / Weighted average (Total Costs)

**Step P10 - Calculate Adjusted Cost Share for 4th-tier Cost Categories**

The cost categories that can be elected to be moved to the 4th tier are oral contraceptives, anti-histamines, cold & cough, and lifestyle. If they are not elected to be moved to the 4th tier, use the regular cost share calculated in Step P9. If they are moved to 4th tier, increase cost share by 5%.

Adding a class to the 4th tier should always increase the cost share for that class, but with minimal impact to overall rates due to low utilization levels.

Formula:

Step P10 Adjusted Cost Share = Step P9i Regular Member Cost Share x 1.05

**Step P11 - Calculate Regular Cost Share PMPM, Regular Net Pharmacy PMPM, and Adjusted Cost Share PMPM**Formulas:

Step P11 Regular Cost Share PMPM = Step P8 Gross Area-Adjusted PMPM x Step P9i Regular Member Cost Share

Step P11 Regular Net Pharmacy PMPM = Step P8 Gross Area-Adjusted PMPM - Step P12 Regular Cost Share PMPM

For all regular cost categories *and* other categories that have *not* been moved to 4th tier, use the following:

Step P11 Adjusted Cost Share PMPM = Step P8 Gross Area-Adjusted PMPM x Step P9i Regular Member Cost Share

For cost categories that have been moved to 4th tier, use the following:

Step P11 Adjusted Cost Share PMPM = Step P8 Gross Area-Adjusted PMPM x Step P10 Adjusted Cost Share

**Step P12 - Calculate Aggregate Metrics**

Many of these aggregate metrics are only used for analysis purposes and visibility.

**Step P12a - Aggregate AWP**

Calculated by doing a sumproduct of each category's AWP with its corresponding script count and dividing by the total script count.

Example (assuming only retail generic and retail preferred brand categories):

(a) = Retail Generic AWP = \$50

(b) = Retail Preferred Brand AWP = \$125

(c) = Retail Generic Script Count PMPY = 4

(d) = Retail Preferred Brand Script Count PMPY = 2

Aggregate AWP =  $(a \times c + b \times d) / (c + d) = (50 \times 4 + 125 \times 2) / 6 = 75$

#### Step P12b - Aggregate Discounted AWP, Dispensing Fee

Calculated in the same way as Aggregate AWP in Step P12a.

#### Step P12c - Aggregate Discount

Calculated by "backing into it" using Aggregate AWP and Aggregate Discounted AWP.

#### Formula:

Step P12c Aggregate Discount =  $1 - (\text{Step P12b Aggregate Discounted AWP} / \text{Step P12a Aggregate AWP})$

#### Step P12d - Aggregate Cost Trend Factor, Utilization Trend Factor, Area Factor, and Regular Cost Share

These metrics are equal across all categories, and are thus the same in aggregate.

#### Step P12e - Aggregate Gross Cost per Script and Gross Trended Cost per Script

Calculated in the same way the individual cost categories are calculated.

#### Formulas:

Step P12e Aggregate Gross Cost per Script = Step P12b Aggregate Discounted AWP + Aggregate Dispensing Fee

Step P12e Aggregate Gross Trended Cost per Script = Step P12e Aggregate Gross Cost per Script x Step P12d Aggregate Cost Trend Factor

#### Step P12f - Aggregate Script Counts, Trended Script Counts, Gross Trended PMPM, Gross Area Rx PMPM, Regular Cost Share PMPM, Regular Net Pharmacy PMPM, and Adjusted Cost Share PMPM

Calculated by summing up the corresponding metrics across all cost categories.

#### Step P12g - Aggregate Adjusted Cost Share

Calculated by "backing into it" using Aggregate Gross Area Rx PMPM and Aggregate Rx Cost Share PMPM.

#### Formula:

Step P12g Aggregate Adjusted Cost Share =  $\text{Step P12f Aggregate Adjusted Cost Share PMPM} / \text{Step P12f Aggregate Gross Area Rx PMPM}$

**All calculations going forward are done on an aggregate basis only (i.e. not split into cost categories).**

#### Step P13 - Calculate the Net Pharmacy Rate

#### Formula:

Step P13 Net Pharmacy Rate =  $\text{Step P12f Aggregate Gross Area-Adjusted PMPM} - \text{Step P12g Aggregate Adjusted Cost Share PMPM}$

#### Step P14 - Apply the Clinical Modules Factor

Extract the Clinical Modules factor, which is dependent upon which modules/GST programs are selected.

#### Formula:

Step P14 Clinical-Adjusted PMPM =  $\text{Step P13 Net Pharmacy Rate} \times \text{Clinical Modules Factor}$

#### Step P15 - Apply the Pharmacy Demographic Adjustment

Extract the age/sex factor from Rx Demo Factors table for the demographic of the case being run and apply to the Step 14 Clinical-Adjusted PMPM. The factor will be calculated in the same way as is done for Medical, just using a different table.

Formula:

Step P15 Clinical/Demo-Adjusted PMPM = Step P14 Clinical-Adjusted PMPM x Pharmacy Demographic Factor

#### Step P16 - Apply the Pharmacy Industry Adjustment

Extract the unadjusted industry factor and apply it to the PMPM calculated in Step P15.

Formula:

Step P16 Clinical/Demo/Industry-Adjusted PMPM = Step P15 Clinical/Demo-Adjusted PMPM x Industry Factor

#### Step P17 - Apply the Pharmacy Mandates Adjustment

Extract the mandate factor from the Rx Mandate Factors table for the state/funding type of the case being rated and apply it to the PMPM calculated in Step P16.

Formula:

Step P16 Clinical/Demo/Industry/Mandate-Adjusted PMPM = Step P16 Clinical/Demo/Industry-Adjusted PMPM x (1 + Mandate Factor)

#### Step P18 - Calculate and Apply Utilization Dampening Adjustment

Extract the Utilization Dampening Adjustment based on member cost share and apply it to the Step 17 Clinical/Demo/Industry/Mandate-Adjusted PMPM.

Formula:

Step P18 Total Benefit Pharmacy CRC = Step P17 Clinical/Demo/Industry/Mandate-adjusted PMPM x Utilization Dampening Adjustment

#### **SECTION PB**

##### Step P19 - Determine Final Pharmacy CRC

Extract the pharmacy loading factor based on applicable community rate adjustments, similar to medical, and apply it to the PMPM calculated in Step P18 to get the community rate by class (CRC) PMPM. This includes items such as multiple offering loads, open access loads, women's preventive health adjustments, combined deductible adjustments, and deductible accumulation adjustments. Then take out the industry and demographic factors to get to the community rate (CR) PMPM.

Formula:

Step P19 Final Pharmacy CRC = Step P18 Total Benefit Pharmacy CRC x Pharmacy Loading Factor

Step P19 Final Pharmacy CR = Step P19 Final Pharmacy CRC / Industry factor / Demographic factor

#### **SECTION PC**

##### Step P20 - Aggregate Individual Claim Costs

Combine the individual per member per month claim costs to determine aggregate costs by area.

Step P20 Total Aggregated CRC by Area =  $\frac{\text{Sum of the Step P19 Final Pharmacy CRC for all individuals (members) within the given area}}{\text{Sum of the number of individuals (members) within the given area}}$

Step P20 Total Aggregated CR by Area =  $\frac{\text{Sum the Step P19 Final Pharmacy CR for all individuals (members) within the given area}}{\text{Sum of the number of individuals (members) within the given area}}$

### **Experience Rating Formula for CGLIC Medical Products**

Blended claims are a weighted average of the group's official experience and the manually rated claims.

The group's official experience is calculated as fee-for-service paid claims, adjusted for large claims and capitation, then multiplied by a trend factor. Large claims up to the pooling limit are added back in. The claims are then adjusted for any changes in liability. This experience could include CIGNA experience on the particular group or a portion of the group or prior carrier experience.

The manually rated claims are calculated according to the formulas and tables filed and approved with the state.

The weights used to blend the claims are based on the credibility of the group. The blended claims may be adjusted for underwriting discretion. A retention charge is then added for administrative expenses, taxes, commissions and profit. The premium is then adjusted for the Experience Protection Benefit (pooling charge) and network access fees, where applicable.

**TIERED BENEFITS ADJUSTMENT**

- 1) A manual rate will be developed for the underlying plan, consistent with this filing's base methodology and reflecting the Tier 1 level of cost sharing for Specialty/Primary office visits.
- 2) An adjustment will be made to this rate if the employer's premium contribution strategy will favor the Care Network option by at least 10%.  
(This would always be true if Tiered Benefits is offered on a full replacement basis.)  
The rate adjustment will equal ( 1 - Savings % ), according to the following formula:
- 3) If a client decides to administer the Tier 1 benefit to non-CCN services (no-cut dollars), benefit save is not multiplied by the % of members in the no-cut group.
- 4) PCP and SCP savings are calculated separately and then combined for a total impact to the manual rate.

$$\text{Savings \%} = [1 - \% \text{ out-of-network}] \times [ \text{benefit save} \times \text{CCF dilution \%} \times \% \text{ non-HPN dollars} + \text{benefit save} \times \text{CCF dilution \%} \times \% \text{ no-cut dollars}] \times \text{Dual Choice Adjustment}$$

**TABLES**

**General (example):**

Starting Save, % non-HPN dollars, and % no-cut dollars are developed by area based on Care Network contracting data.

**% out-of-network**

Developed for the underlying plan, consistent with this filing's base methodology and reflecting the Tier 1 benefit level

**CCF Dilution %**

**Medicare COB Factor Language**

Rates for Post-65 Medicare Eligible Retirees are adjusted to reflect the coordination of benefits with Medicare. The Medicare COB adjustment is based on the percentage of Medicare eligible members in the population being rated, the age/sex, the geographic location of the membership, the coordination of benefits method being applied, the underlying medical product type, and the plan deductible, coinsurance, copay, out-of-pocket maximum, and other cost-sharing.

**ADVERSE SELECTION ADJUSTMENT FOR MULTIPLE CHOICE SCENARIOS WITH LESS THAN 6 OFFERINGS**

<b>Multiple Offering Loads</b>	
<b><u>Offerings</u></b>	<b><u>Load</u></b>
1	0.0%
2	2.0%
3	2.5%
4+	3.0%

Platform	Riders
Proclaim and Facets	All riders are multiplied by (1) <b>Area Factor</b> , (2) <b>Medical Trend (IN or OON where appropriate)</b> , (3) <b>Rider Load</b> (this incorporates the Multiple Offering, Deductible Accumulation, Open Access, Preventive Care, CCF, Breast Pump Supplies, & Combined Deductible), (4) <b>Demographic Factor</b> (equivalent to the medical demographic factor load), and (5) <b>Industry Load</b> . **Couple of exceptions for Vision and Infertility
	** Vision has a different trend. Infertility has a different area factor and a different demographic adjustment.
Proclaim	<b>Preventive - Routine Care Age &lt;= 2 (OON Buy Up)</b> 1.573 is the PMPM charged when selecting the OON buy-up. This value is constant.
Proclaim and Facets	<b>Preventive - Routine Care Age 3+ (Max Amt) and FACETS PreventativeOtherServicesThresholdFor100PctCoverage IN</b> The value of 4.31900392 is the PMPM charged when Preventive Care is not selected The value of 0.0013005 is the slope, which is multiplied the max dollar amount chosen for preventive services. This number would be added to the value of 4.31900392. The PMPM is capped at 6.46482892
Proclaim and Facets	<b>Preventive - Routine Care Age 3+ (OON Buy Up) and FACETS PreventativeOtherServicesThresholdFor100PctCoverage OON</b> IN PMPM multiplied by the POS load
Proclaim	<b>Outpatient Short Term Rehab Therapy and Chiro (Max Visit)</b> 0.126882 is slope for the first 30 visits 0.052388 is the slope for all visits after the first 30 visits example: If 45 days were selected, to get you PMPM you would do the following: (30*0.126882 + 15*0.052388) The PMPM is capped at 6.95 (approx. 90 visits)
Proclaim and Facets	<b>Chiropractic Care (Max Amt) and FACETS ChiroMaxAmt</b> For the first \$1020 of the Max Amount, take the (Max Amount/17)*0.05  * Notice how the same slope was used as in the Max Visit above. (Max Amount/17) transforms the dollar amount into a Max Visits amount.  For all Max Amount dollars after \$1021 use slope of 0.013333. The PMPM is capped at 3.40 (approx. \$1530 Max Amount)
Proclaim and Facets	<b>Chiropractic Care (Max Visit) and FACETS ChiroMaxDays</b> 0.05 is slope for the first 60 visits 0.013333 is the slope for all visits after the first 60 visits The PMPM is capped at 3.40 (approx. 90 visits)
Facets	<b>FACETS OutpatientPT_STRMaxDays IN</b> 0.093141 is slope for the first 20 visits 0.021866 is the slope for all visits after the first 20 visits example: If 45 days were selected, to get you PMPM you would do the following: (20*0.093141 + 25*0.021866) The PMPM is capped at 3.174758 (approx. 80 visits)
Facets	<b>FACETS OutpatientSpeechHearingOccupationalMaxDays</b> 0.01 is slope for the first 20 visits 0.0025 is the slope for all visits after the first 20 visits example: If 45 days were selected, to get you PMPM you would do the following: (20*0.01 + 15*0.0025) The PMPM is capped at 0.375 (approx. 90 visits)
Facets	<b>FACETS OutpatientSpeechHearingOccupationalMaxAmI</b> For the first \$600 of the Max Amount, take the (Max Amount/30)*0.01  * Notice how the same slope was used as in the Max Visit above. (Max Amount/30) transforms the dollar amount into a Max Visits amount.  For all Max Amount dollars after \$601 use slope of .0025. The PMPM is capped at 0.375 (approx. \$2,700 Max Amount)
Proclaim and Facets	<b>PAR Infertility Treatment - Buy Up #1 and Facets Family Planning 1</b> 2.1869133 is the PMPM charged when selecting this option. This value is constant.
Proclaim and Facets	<b>PAR Infertility Treatment - Buy Up #1 OON and Facets Family Planning 1 OON</b> IN PMPM multiplied by the POS load
Proclaim and Facets	<b>Infertility Treatment - Buy Up #2 and Facets Family Planning 2</b> All PMPMs are based of the value 8.4317519 Slope = ((Max/18,500)^(0.5)) Final PMPM = 8.4317519*Slope The PMPM is capped at 16.4014015
Proclaim and Facets	<b>Infertility Treatment - Buy Up #2 OON and Facets Family Planning 2 OON</b> IN PMPM multiplied by the POS load

Proclaim	<b><u>Preventive - Routine Care Age &lt;= 2 (OON Buy Up)</u></b> 1.573 is the PMPM charged when selecting the OON buy-up. This value is constant.
Proclaim and Facets	<b><u>Alternative Care (Acupuncture, Naturopath, Massage)</u></b> Options for Acupuncture and Naturopath therapy with or without Massage are available at \$300 or \$600 annual maximums. The PMPM's without Massage are 1.4355 and 2.0955 respectively, and with Massage they are 1.6555 and 3.0855 respectively
Proclaim and Facets	<b><u>Acupuncture (if any Alternative Care option is elected, then this doesn't apply)</u></b> IN PMPM equals 0.517 for 12 visits, and equals 0.7755 for 20 and 24 visit options.
Proclaim and Facets	<b><u>Organ Transplants OON Covered</u></b> 0.22 is the PMPM charged when selecting the OON Transplants buy-up. This value is constant.
Proclaim	<b><u>Durable Medical Equipment</u></b> The PMPM is capped at 1.35
Proclaim	<b><u>Durable Medical Equipment OON Buy Up</u></b> IN PMPM multiplied by the POS load
Proclaim	<b><u>External Prosthetic Appliances</u></b> The PMPM is capped at 0.271
Proclaim	<b><u>External Prosthetic Appliances OON Buy Up</u></b> IN PMPM multiplied by the POS load
Facets	<b><u>Durable Medical Equipment and External Prosthetic Appliances</u></b> The PMPM is capped at 1.621
Facets	<b><u>Durable Medical Equipment and External Prosthetic Appliances OON Buy Up</u></b> IN PMPM multiplied by the POS load
Proclaim and Facets	<b><u>Routine Foot Disorders Buy Up</u></b> 0.935 is the PMPM charged for Max Amounts less than 1,000. 1.10 is the PMPM charged for Max Amounts larger than \$1,000
Proclaim and Facets	<b><u>Routine Foot Disorders Buy Up OON</u></b> IN PMPM multiplied by the POS load
Proclaim and Facets	<b><u>Home Health Care (Max Visit)</u></b> The Standard (free) benefit is a 60 day max (-1.144) is the PMPM charged when Max Visits is set to zero. The value of 0.01733333 is the slope multiplied by the number of Max days selected. This product is then added to the value of (-1.144). This corresponds to 60 max days being the Standard (free) benefit. The PMPM is capped at 1.243
Proclaim and Facets	<b><u>TMJ</u></b> 0.341 is the PMPM charged when selecting the TMJ buy-up. This value is constant
Proclaim and Facets	<b><u>Bariatric Surgery</u></b> 2.97 is the PMPM charged for Max Amounts less than or equal to \$8,000 and the value of 3.157 is the PMPM charged for Max amounts greater than \$8,000
Proclaim and Facets	<b><u>Complex Psych Program Savings</u></b> (-0.165) is the PMPM charged when this benefit is selected. This value is constant
Proclaim and Facets	<b><u>Narcotics Therapy Program Savings</u></b> (-0.165) is the PMPM charged when this benefit is selected. This value is constant

**FACETS Vision Riders**

Determine the **product type** and which methodology to use

- 1) If *plan name* is one of the existing medical vision riders from *tableVisionTranslate*, then proceed under the old methodology by looking up the rates by product name and plan name in *tableVisionRiderPMPM*.
- 2) Next, determine whether the **product type** is indemnity or PPO:
  - a) If it is a Facets/CIGNA West product, then it is indemnity
  - b) If it is a CIGNA Vision product, then it is PPO (*currently not rated in MRE*)

Calculate **effective trend** as follows:

- 1) The **experience period midpoint** is 7/1/2010.
- 2) The **rating period begin date** is the *effective date*.
- 3) The **rating period end date** is the *option date*.
- 4) The **rating period midpoint** is the average of the *effective date* and *option date*.
- 5) **Annualized trend** is set at 3.0%.
- 6) **Effective trend** = (1 + **annualized trend**) ^ (number of days in **rating period midpoint** - **experience period midpoint**) / 365.25)

Vision trend is generally low. Scheduled fees tend to increase year-over-year for exams but decrease for materials, which balances out to slightly positive trend. Most of real trend is due to increased utilization, but the pricing assumes trend shows up in cost.

The **tiering cost factor** is calculated as follows:

- 1) If the census is a demographic census, then the **tiering cost factor** is the Grand Composite Cost ACS from *tableVisionTiering* multiplied by the aggregate medical demo factor.
- 2) If the census is a relationship census, then the **tiering cost factor** is calculated as follows:
  - (a) *subscribers* multiplied by the cost from *tableVisionRelationship*
  - (b) *spouses* multiplied by the cost from *tableVisionRelationship*
  - (c) *dependents* multiplied by the cost from *tableVisionRelationship*
  - (d) [(a) + (b) + (c)] divided by total subscribers

The **tiering cost factor** is 2(e) from above.

**tableVisionTiering**

Tier	Cost ACS	Member ACS	Distribution
Subscribers Single	1.000	1.000	46.9%
Subscribers Two Party	2.000	2.000	18.1%
Subscribers EE+Child	2.020	2.700	9.7%
Subscribers Family	3.224	4.040	25.3%
Grand Composite	1.936	2.110	100.0%

**tableVisionRelationship**

Tier	Cost
Subscriber	1.000
Spouse	1.000
Dependent	0.600

There are no demo factors used to price vision, other than a load for 65+. The implied demo factors are built into the Cost ACS factor, since children have lower claim costs.

The **65+ load** is calculated as follows:

- 1) If the census is a demographic census, then the **65+ load** is 1.00.
- 2) If the census is a relationship census, then the **65+ load** is calculated as follows:
  - (a) the sum of all subscribers 65+ divided by *calcCensusTotalSubscribers*
  - (b) (a) \* a 65+ factor from *table65Load*

**table65Load**

Age	Load
65-	1.000
65+	1.100

The 65+ load reflects increased utilization of bifocal, trifocal, and progressive lens by those aged over 65+ compared to the general adult population.

The **small group load** is calculated as follows:

- (1) If calcCensusTotalSubscribers is less than 50, then the **small group load** is the factor from **tableSGLoad**
- (2) Otherwise, it is 1.00

**tableSGLoad**

Subscribers	Load
1	1.000
50	1.050

The small group load applies due to antiselection in smaller cases.

The **industry load** is calculated as follows:

- (1) Look up the industry factor using the caseSIC from **tableIndustryLoad** below

**tableIndustryLoad**

SIC Code	Factor
0	1.000
1000	1.000
1500	0.930
2000	1.225
4000	1.010
5000	1.130
5200	1.110
6000	1.110
7000	1.140
7200	1.110
7300	1.090
7500	1.000
7600	0.930
7800	1.000
7900	1.000
8000	1.035
8100	1.035
8200	1.085
8300	0.870
8400	1.120
8600	1.130
8900	1.100
9100	1.120
9999	1.000

The industry load reflects different utilization patterns across industries either due to eyewear requirements (cosmetic or otherwise), better product awareness, or eye health.

The **frequency load** is calculated as follows:

- (1) Determine if the plan design covers an exam only or materials as well.
- (2) If it covers an exam only, look up the exam frequency load from **tableExamFrequency** using input *VisionEyeExamFrequency*.

**tableExamFrequency**

Frequency	Factor
12	1.01
24	0.756

- (3) If it covers materials as well, lookup the corresponding frequency loads from **tableComprehensiveFrequency** using input *FACETS\_VisionLensesContactsFramesFrequency*.

**tableComprehensiveFrequency**

Frequency	Exam	Lenses	Contacts	Frames	Materials
12	1.01	1.047	1.052	1.441	1
24	0.756	0.681	0.620	0.865	0.773

The frequency load accounts for different utilization patterns given a 24 month coverage period.

The **comprehensive exam load** is calculated as follows:

- (1) Lookup the comprehensive exam load from **tableComprehensiveExam**.

Type of Plan	Factor
Comprehensive	1.66
Exam	1

When materials are covered as well as the exam, members are 62% more likely to get an exam compared to members in an exam only plan.

Calculate the **network utilization** as follows:

- (1) Lookup the network utilization based on **product type** from **tableNetworkUtilization**.

Product Type	Private	Retailer	OON
PPO	89.8%	10.2%	4.5%
Indemnity	89.8%	10.2%	100.0%

For the PPO, approximately 90% of IN network utilization goes to independent, private retailers. The other 10% goes to chain retailers. About 5% of total utilization goes out of network for PPO type plans.

For indemnity plans, all 100% is "out of network," so to speak.

Calculate the **total cost per exam claim** as follows:

- (1) Lookup the relevant row from **tableExamCost** using *Site*.
- (2) Calculate the **in-network average total cost per exam claim** as follows:
- (a) if the **product type** is indemnity, this is \$0.00
  - (b) if the **product type** is PPO, then this is the **retailer utilization** times the retailer scheduled cost from **tableExamCost** plus the **independent utilization** times the independent scheduled cost from **tableExamCost**
  - (c) (b) times the **effective trend**
- (3) Calculate the **out-of-network average total cost per exam claim** as follows:
- (a) the retailer utilization times the retailer U&C cost from **tableExamCost** plus the independent utilization times the independent U&C cost from **tableExamCost**
  - (b) (a) times the **effective trend**

The idea here is to take calculate the IN and OON average claim cost separately, since benefits are different in each case. Then each claim cost can be used to figure out the expected claim cost IN vs. OON based on the benefit design.

Calculate **member cost share** and **claims cost** per service type as follows:

- (1) Calculate the IN and OON **member cost share per service type** in terms of dollars for utilization dampening:
  - (a) if there is a copay for a service, then this is the member cost share for that service
  - (b) if the service type is contact lens or frames and there is an allowance, then the member cost share is 0
  - (c) if there is a single allowance for all materials combined (contact lenses, frames, and lenses), then the member cost share is 0
  - (d) if there is an allowance for a specific service type, then the member cost share is the average total cost for that service minus the allowance (floored at 0)
- (2) Calculate the IN and OON **claims cost per service** for each service type in terms of dollars.
  - (a) if there is a copay for a service, then the claims cost is the average total cost for that service minus the copay
  - (b) if the service type is contact lens or frames and there is an allowance, then the claims cost is the allowance
  - (c) if there is a single allowance for all materials combined (contact lenses, frames, and lenses), then the member claims cost is the allowance
  - (d) if the service type is not contact lens or frames and there is an allowance, then the claims cost is the lesser of the average total cost for that service or the allowance

Increased member cost share decreases utilization. The only exception is for services where the unit costs are variable and there is an allowance. Frames and contact lens fall into this category. Members can purchase more expensive frames given a higher frames/materials allowance. They can also increase the number of contact lens purchased given a higher contact lens/materials allowance.

Calculate the **utilization dampening factor** as follows.

- (1) The exam utilization dampening factor is the greater of 50% or 1 - (exam factor **frontableUD** times the dollar member cost share).
- (2) The materials utilization dampening factor is the greater of 50% or 1 - (materials factor **frontableUD** times the dollar member cost share).

**tableUD**

Service	Factor
Exam	-0.72%
Materials	-0.20%

Each dollar of additional member cost share reduces the expected utilization for that service by .72% for exams and .2% for materials. It's capped at 50% to reflect that some members will utilize the service regardless of coverage, due to discounts, or otherwise (actual number is lower than this).

Calculate the **total utilization load** as follows.

- (1) **65+ load**
- (2) **small group load**
- (3) **industry load**
- (4) **tiering cost factor**
- (5) The **total utilization load** is (1) x (2) x (3) x (4).

This load gets applied to all service types IN and OON.

Calculate utilization for exams as follows.

- (1) Lookup exam base utilization from **tableServiceUtilization**.
- (2) Calculate **exam utilization load** as follows:
  - (a) **total utilization load**
  - (b) **frequency load** for exam
  - (c) **comprehensive exam load**
  - (d) **utilization dampening factor**
  - (e) (a) x (b) x (c) x (d)
- (3) If **product type** is PPO, calculate **IN exam utilization** as follows:
  - (a) Base utilization
  - (b) **exam utilization load**
  - (c) (a) x (b)
- (4) If **product type** is PPO, calculate **OON exam utilization** as follows:
  - (a) Base utilization divided by [(1 - OON utilization)/OON utilization]
  - (b) **exam utilization load**
  - (c) (a) x (b)
- (5) If **product type** is indemnity, calculate **OON exam utilization** as follows:
  - (a) Base utilization divided by (1 - **OON utilization**)
  - (b) **exam utilization load**
  - (c) (a) x (b)

**tableServiceUtilization**

Service Type	IN Subscriber	Category
Exam	39.49%	Exam
Frames	29.03%	Frames
Single Vision	29.71%	Lens
Contact Lenses	13.55%	Contact Lens
Progressive lenses	6.01%	Lens
Contact Lens Exam	9.36%	Contact Lens
Bifocal	5.13%	Lens
Polycarbonate	15.65%	Lens
Antireflective	19.65%	Lens
Trifocal	0.53%	Lens
Photochromic	8.74%	Lens
Scratch Coat	2.57%	Lens
UV	0.66%	Lens
Lenticular Lens	0.02%	Lens
Therapeutic CL	0.20%	Lens
Safety Glasses	12.95%	Frames
Tints	1.66%	Lens
Materials	40.08%	Materials

The subscriber utilization in the table above is based on utilization count divided by eligible subscribers.

Calculate utilization for materials as follows.

- (1) If the plan has a single allowance for all materials (contact lenses, lenses, frames), look up the base "Materials" utilization from **tableServiceUtilization**. Otherwise, look up base materials utilization by service type.
- (2) Calculate the **materials utilization load** as follows:
  - (a) **total utilization load**
  - (b) **frequency load** for total materials or service type
  - (c) **utilization dampening factor**
  - (d) 1.50 if additional materials are covered, 1.0 otherwise
  - (e) (a) x (b) x (c) x (d)
- (3) If **product type** is PPO, calculate **IN materials utilization** as follows:
  - (a) Base utilization for total materials or service type
  - (b) **materials utilization load**
  - (c) (a) \* (b)
- (4) If **product type** is PPO, calculate **OON materials utilization** as follows:
  - (a) Base utilization divided by [(1 - **OON utilization**)/**OON utilization**]
  - (b) **materials utilization load**
  - (c) (a) \* (b)
- (5) If **product type** is indemnity, calculate **OON materials utilization** as follows:
  - (a) Base utilization divided by (1 - **OON utilization**)
  - (b) **materials utilization load**
  - (c) (a) \* (b)

Calculate average in network claim cost for each service type as follows:

- (1) If **product type** is indemnity, then this is zero for all service types.  
Otherwise, proceed to step 2.
- (2) Calculate the IN PEPM claim cost for each service (including combined materials allowance) as follows:
  - (a) **IN claims cost per service**
  - (b) **IN utilization**
  - (c) (a) x (b) divided by policy period length in months (i.e. 12 for 1 year)
- (3) Calculate the IN PEPM cost share for each service as follows:
  - (a) **IN cost share per service**
  - (b) **IN utilization**
  - (c) (a) x (b) divided by policy period length in months (i.e. 12 for 1 year)

Calculate average out of network claim cost for each service type as follows:

- (1) Calculate the OON PEPY claim cost for each service (including combined materials allowance) as follows:
  - (a) **OON claims cost per service**
  - (b) **OON utilization**
  - (c) (a) x (b) divided by policy period length in months (i.e. 12 for 1 year)
- (2) Calculate the OON PEPM cost share for each service as follows:
  - (a) **OON cost share per service**
  - (b) **OON utilization**
  - (c) (a) x (b) divided by policy period length in months (i.e. 12 for 1 year)

Calculate the final **PEPM** and **PMPM rate** as follows.

- (1) Calculate the **PEPM manual rate** by summing up the IN and OON PEPM claim costs across all service types.
- (2) Calculate the **PMPM manual rate** as follows:
  - (a) PEPM manual rate
  - (b) average contract size: total members divided by total subscribers
  - (c) (a) divided by (b)
- (3) Calculate the **PEPM cost share** by summing up the IN and OON PEPM cost share across all service types.
- (4) Calculate the **cost share %** as follows:
  - (a) 
$$\frac{[\text{PEPM cost share}]}{[\text{PEPM cost share} + \text{PEPM manual rate}]}$$
- (5) Any rollups should be done by summing up the raw dollar amounts and dividing by the sum of the members or subscribers.

## **EXHIBIT I**

### ACTUARIAL MEMORANDUM AND CERTIFICATION

#### Scope and Purpose

The purpose of this filing is to submit Connecticut General Life Insurance Company's (CGLIC) group manual rating methodology. Our pricing model was developed to provide a consistent rating methodology across products. This filing includes Open Access Plus, PPO, Network, Indemnity, and retiree medical insurance product, and is applicable for groups of 51 or more lives. Methodology is also included for Pharmacy products.

#### Benefit Description

The benefits covered in this memorandum include group health insurance coverage as described in Connecticut General Life Insurance Company forms GM5800 et al and GM6000 et al.

#### Census

Member level census will be used when available. If only subscriber level data is available, penetration and translation assumptions will be used to create a member level census for manual rate development. The penetration and translation assumptions used are developed from studies of our book of business. Penetration estimates the number of subscribers that will select the CGLIC plan; the translation process develops projected subscribers and members within rating tiers.

#### Adjustments to Base Claims

The base claim rates by area are adjusted for certain group and member characteristics. These include industry loads and discounts, age and sex demographic adjustments, and trends.

Adjustments for industry (SIC) are developed from a study of our book of business combined with results from an outside consultant's national industry factor assessment study.

Age and sex demographic adjustments are developed from a study of our book of business. The resulting age/sex slopes are normalized to represent the national census.

Trends reflect historical experience from CGLIC's group medical experience and projections for future levels. Medical trend rates are applied on a daily basis.

#### Benefit Plan Adjustments

Base claims are reduced for specific cost sharing features of the product and benefit plan selected. Copay and other cost sharing benefit design related adjustments are made using assumptions regarding utilization levels by base claim component. Claim distributions are used to determine the impact of deductibles, coinsurance and out of pocket maximums. In addition, a utilization dampening factor is applied to reflect lower utilization levels as cost sharing rises.

#### Renewability Clause

The benefit plans covered under this memorandum are guaranteed renewable.

### Applicability

CGLIC, Inc. anticipates both renewals and new issues from the forms currently filed.

### Marketing Method

These products are sold to employer-employee groups, labor union groups and association groups through Connecticut General Life Insurance Company group sales offices.

### Underwriting

Groups are medically underwritten to some extent, though the effects are not currently quantified.

### Premium Classes

Premium rates may vary by product, plan design, geographic area, group demographics, industry, effective date, experience, and underwriting discretion.

### Issue Age Range

There are no issue age restrictions in our policy forms; however, eligibility requirements must be fulfilled.

### Premium Modalization Rules

The Connecticut General Life Insurance Company Health Manual produces monthly premiums. Modalization factors are expressed as a function of these monthly rates as follows:

Annual	11.8227
Semi-Annual	5.9557
Quarterly	2.9852

### Distribution of Business

Rates vary by geographic location and group specific characteristics, including demographics. Target distribution is to groups with both single employees and employees with dependents, assuming a 40/60 distribution

### Experience Rating

The group rates developed from the attached methodology represent the rate level we expect to be necessary to achieve a desired average loss ratio for all group contracts. Accordingly, actual rates for groups will vary as a result of a variety of factors. These include variation in benefit plan, age, gender, family composition, size, industry, area, healthplan claim experience, and underwriting discretion. Depending upon group size, case specific claim experience may be used to adjust the rate.

Credibility is based on group size and months of experience. Rates for partially credible groups are based on a blend of experience and manual rating.

### Anticipated Loss Ratio

The methodology and supporting factors apply to groups of 51 or more employees. The anticipated large group loss ratio for this policy is 85%, using the loss ratio definition consistent with PPACA.

## Comparison to Status Quo

This filing includes a number of changes to our medical and pharmacy rating methodologies. It would be difficult to quantify each change independent of the others, but overall we have computed the following impacts based upon our national book of business:

- Updates to our medical area factors across the country to reflect recent favorable claims experience. Overall this results in roughly a 2.5% decrease to medical expected claims. For the greater Washington, DC area (including parts of Maryland and Virginia) the area factor changes ranged from 0% to -14.5% depending upon the particular zip codes.
- A change in utilization assumptions for 2012 (somewhat forward looking) that result in an overall decrease (national book of business) of roughly 1.5% for medical expected claims.
- Updates to pricing for certain coverage riders, including Chiropractic Care, Durable Medical Equipment, External Prosthetic Appliances, and Therapies. The overall impact is roughly a 1.9% decrease to medical expected claims
- Updates to our pricing methods for plans with a collective (non-embedded) deductible. This sort of deductible is more common with HRA and HSA/HDHP plans. The net impact to our Collective book of business is roughly a 3% increase but overall the impact to our entire book of business is a 0.3% increase to medical expected claims.
- A number of updates to pharmacy pricing factors, including:
  - Average Wholesale Prices
  - Script Counts
  - Trend factors
  - Step Therapy Cost Savings
  - Area Factors

Overall these changes result in an increase of 2.9% to pharmacy claims.

The impact of the methodology as well as area-specific changes for our book of business in the District of Columbia is roughly a 10% decrease to total expected claims (excluding trend).

## Experience

	Year	Earned Premium	Incurred Claims	Loss Ratio
DC	2009	\$11,490,446	\$7,531,068	65.5%
	2010	\$22,918,539	\$12,439,843	54.3%
	2011	\$26,892,366	\$14,423,479	53.6%
National	2009	\$4,081,851,295	\$3,243,214,200	79.5%
	2010	\$4,344,000,960	\$3,617,014,064	83.3%
	2011	\$4,655,284,433	\$4,012,634,348	86.2%

## ACTUARIAL CERTIFICATION

### **Opinion**

In my opinion, the rates were developed using reasonable actuarial assumptions, and the rate levels are reasonable in relationship to the benefits provided. The actuarial data and experience will be maintained by the company and available for review by the Commissioner of Insurance upon request.

I certify that to the best of my knowledge and judgment, this rate filing is in compliance with the applicable laws and regulations of the State. In summary, I believe that the rating assumptions proposed will produce rates which are not excessive, inadequate, or unfairly discriminatory
